Quick Getting Started

1. Add the Cart CMS Stack to your RapidWeaver project (there's a demo one included)
2. Change the PayPal address to yours and publish the page
3. Go to the store admin and start adding your products!

(Nothing will appear in edit or preview so you have to publish and start adding some products)

More Detailed Getting Started

Using this RapidWeaver project as the basis to your store site or just edit the defaults. Let's look at the options.

Stack settings

The image shows two configuration panels. The top panel is titled 'PayPal Settings' and contains the following fields: 'PayPal User' with the value 'hello', 'PayPal Domain' with 'yoursite.com', 'Currency' with 'USD', 'Currency Symbol' with '\$', and 'Language' with 'US'. Below these are 'Return URL' and 'Cancel URL', both set to 'Cart CMS', each with a 'Set Link' button and a page reference 'Page: Cart CMS'. A checkbox for 'Collect Shipping Address?' is checked. The bottom panel is titled 'Store Settings' and contains a checked checkbox for 'Masonry layout?' and a 'Columns' dropdown menu set to '3'.

PayPal user is before the "@" and **PayPal domain** is after (of your PayPal account).

So if my ID was "michael@mysite.com" then enter "michael" and "mysite.com" respectively.

Currency follows the PayPal standards so things like USD, JPY, EUR, GBP, CAD etc More here: <https://developer.paypal.com/docs/api/reference/currency-codes/>

Currency Symbol must match the currency.

Language sets the checkout language so US, GB, FR, ES etc More here: <https://developer.paypal.com/docs/api/reference/locale-codes/#localize-the-checkout-experience>

Return and **Cancel URLs** must be absolute URLs or links to pages for success or failed checkouts.

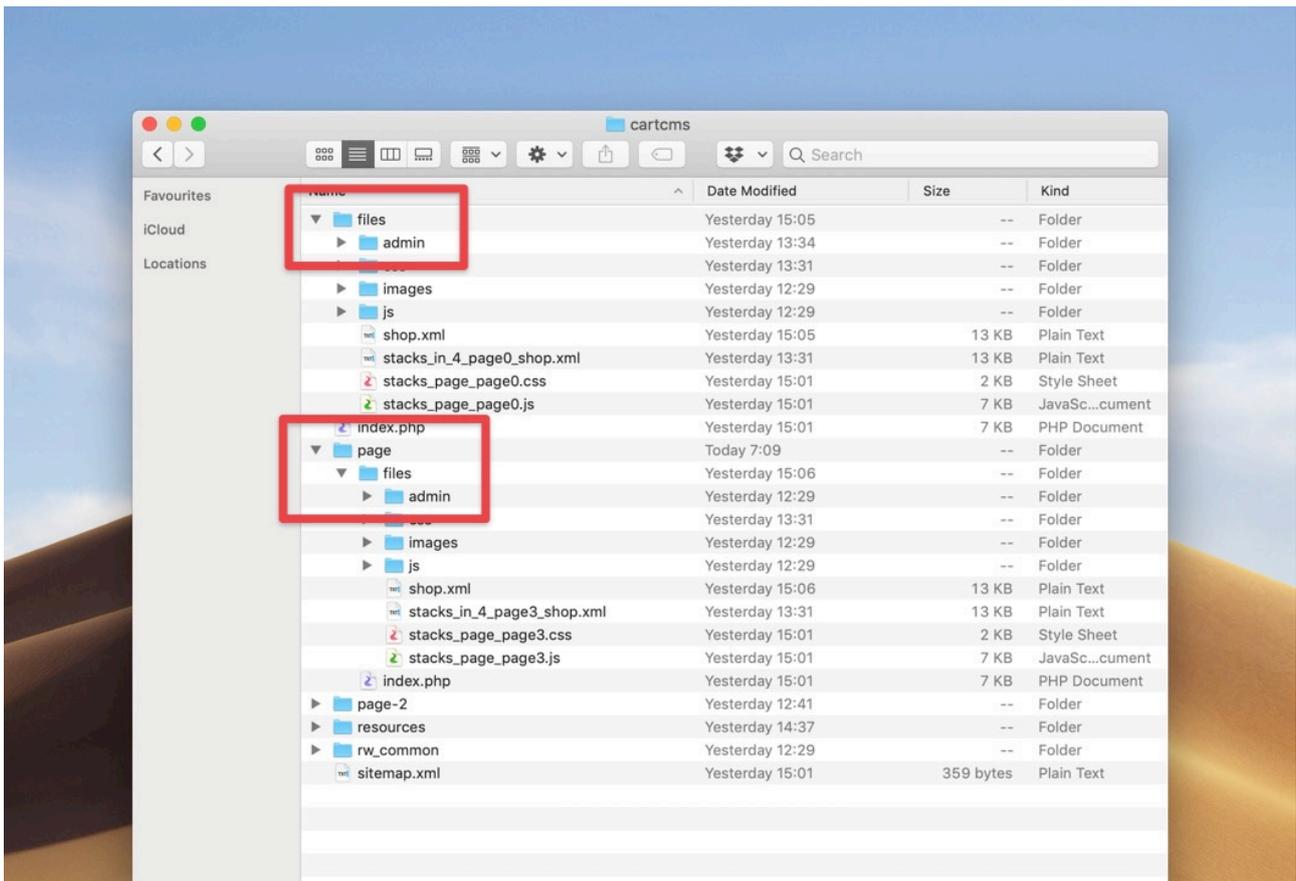

Collect Shipping Address allows you to collect the buyer's address.

Masonry Layout shows the products in a cascading Masonry style and you can set the amount of **columns**.

That's it! Publish this and then let's login to your admin to start adding products.

(Again it's worth noting that nothing will appear in edit or preview so you have to publish and start adding some products to see it working.)

How to find the Admin URL

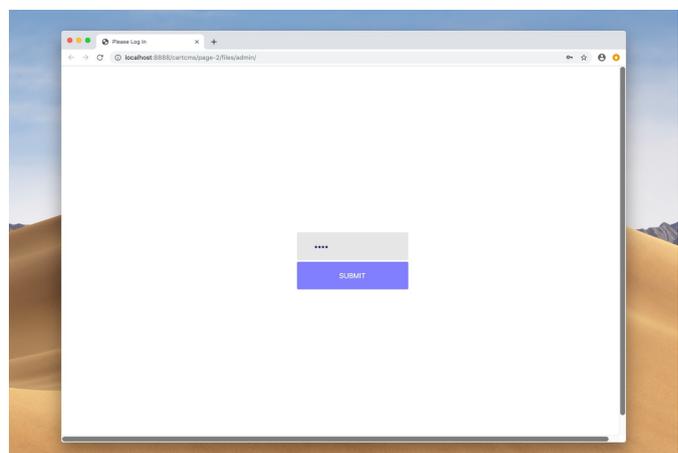

After publishing your site, you can visit the admin in the browser and start adding your products. It will be published in the "files" folder.

So if Cart CMS is on your homepage in the root folder it will be: yourdomain.com/files/admin/
If the cart is on a sub page (or in a sub folder) it will be: yourdomain.com/page/files/admin/

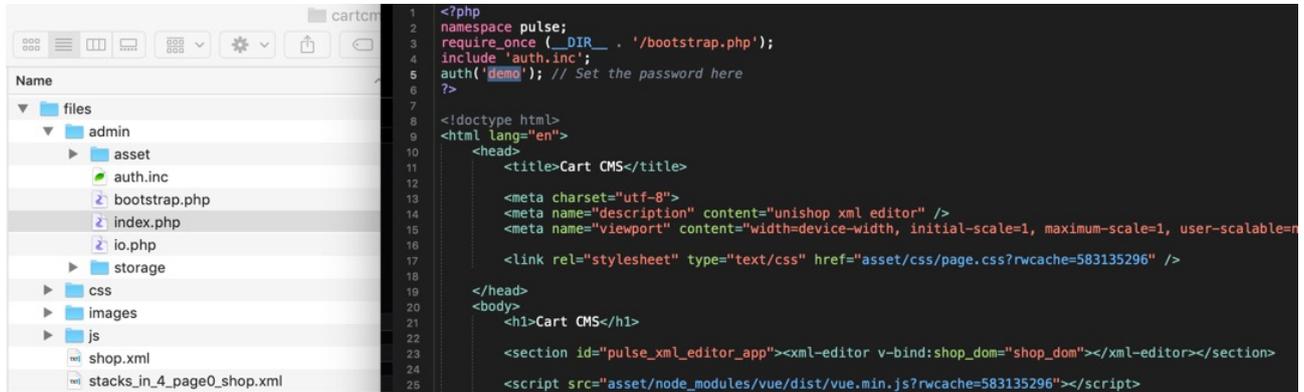

You can see from the demo project, the first page is the top example and the page "layout2" is the second example as it is under the "page" folder in the RapidWeaver page settings.

How to login to Admin

The default password is "demo" - we can change that later.

How to change the Admin password

To change the admin password, go to the index.php file under "files/admin/" on your server (using an FTP programme such as Coda, Transmit or Cyberduck - which is free) and open the index.php with a text editor.

Change Line 5 where it says **demo** into your password of choice and save.

Editing your Store

The store auto builds for you so you now just need to add your products.

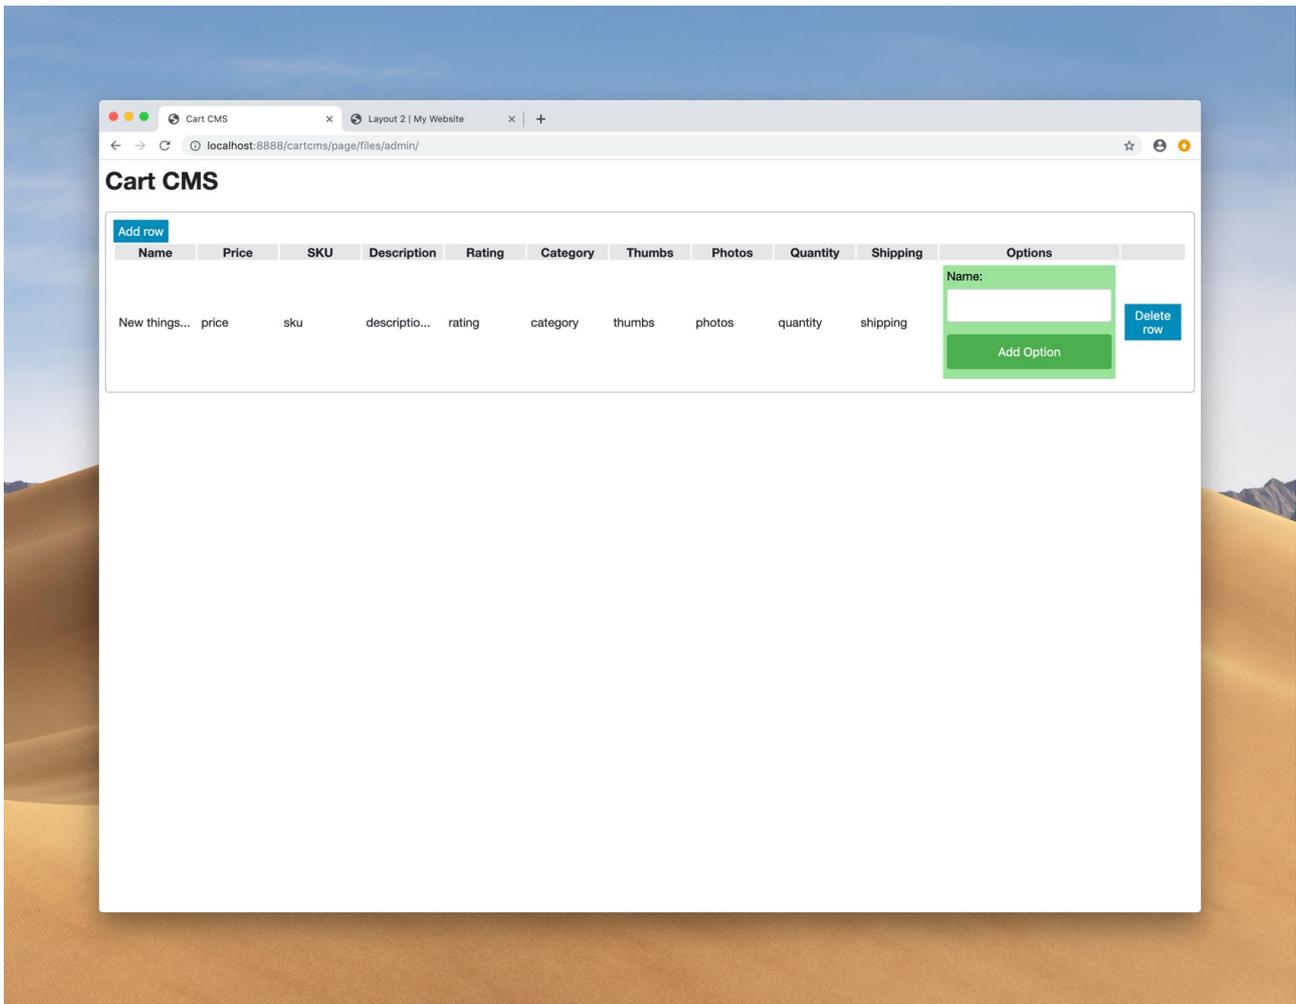

The first product is a dud and can be edited to get you going.

- To edit a product, double click and change the text and click "update"
- To add a new product "add row" and it will appear at the bottom
- To delete a product then "delete row"

Each product can take the following values:

- Name
- Price
- SKU
- Description
- Rating
- Category
- Thumbs
- Photos
- Quantity
- Shipping
- Options

If you leave it empty then it won't appear but we'll look here at an example:

Name

ACDC T-Shirt

Price

30 (no currency or symbol needed)

SKU

sku101 (*up to you*)

Description

Some description

Rating

4.5 (*you set this as a number*)

Category

Music, Rock (*you set this with commas between each*)

Thumbs

resources/photos/pic13_1.jpg, resources/photos/pic13_2.jpg (*appears on the front*)

Photos

resources/photos/pic12_1.jpg, resources/photos/pic12_2.jpg, resources/photos/pic12_3.jpg (*appears on the product description pop-up. Separate by commas*).

(You set the images as links to any image. Warehouse method. They can be absolute or relative links. In this case I added a "photos" folder of images to the RW project and am linking to it as it's published to the server by RapidWeaver).

Quantity

10 (set as a number, and set max and min values as numbers also)

Shipping

1 (set as 1 or 0 as True or False to collect shipping address)

Options

Name:

Add Option

| color | |
|--------------|--------|
| \$10 - black | Delete |
| \$10 - white | Delete |
| \$20 - gold | Delete |

Price:

Value:

Add New

For the options add a name such as "color", "size" or whatever variable.

Then add each price and value (name) of the item.

So it could be "color" and "10" and "black" for a \$10 Black t-shirt.

The price doesn't need the currency symbol as taken from your RapidWeaver settings.

Delete the options you no longer need or delete the whole options to start again.

Known Issues

- Just something to be aware of in some browsers. There's a 1 second delay in the save to allow the data to be written to disk. So please be patient if it doesn't appear instantly. And each option needs to be done and "saved". So *description* or *name* and even each individual *quantity* item for instance
- Sometimes the option may need to be input for a second time if doesn't appear at first (related to the above). But doing it carefully and slowly works each time!

Many thanks!

Happy CartCMS sites building in RapidWeaver and please share with us the sites you make,

Cheers,
Michael
