Grab Stack

Demo: <http://demo.yuzoolthemes.com/grab/>

General Settings

These should be straight forward. Options for setting up the Grab Stack:

jQuery

Enable this for the page. If using multiple Grab Stacks on the page it's not necessary to be activated for subsequent instances.

URL

The site to be Grab the HTML from.

Result

This is the name of the div ID where the Grabbed content will go. Leave this as "result" if only one instance on the page. For multiple instances, each requires its own name

Spinner

You can enable /disable the loading spinner before the content is Grabbed into your RapidWeaver page.

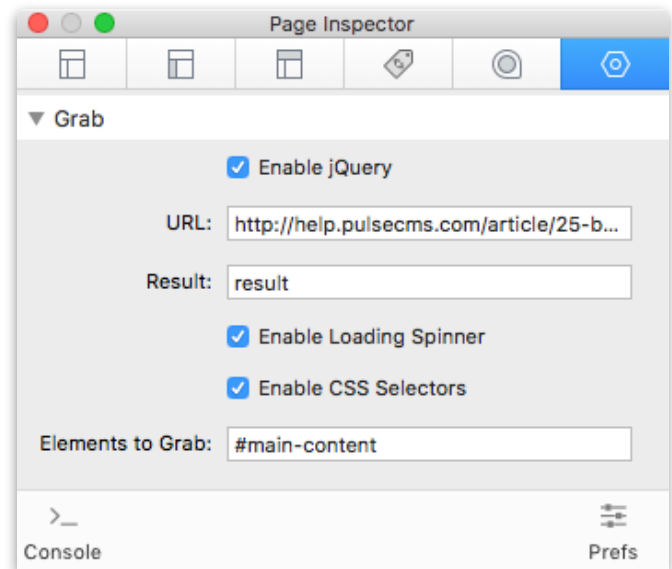

Enable CSS Selectors

To grab the whole page leave this disabled. For specific elements from a page insert the element selectors here, with multiples separated by commas.

Some examples:

#main-content

header,.class,#id

Some things to bear in mind

1. Grabbed elements are updated on page load (if updated from external source)
2. **Please use responsibly.** Only grab content you are allowed to display on your site
3. You will get the HTML but it won't have any CSS applied. If you want to use the same styles please copy & paste those into your page inspector CSS. If the HTML element names are the same your theme will style them
4. You can display multiple Grabs from multiple sources on any RapidWeaver page
5. This cannot Grab content from membership (locked by password) sites
6. Images and videos will be shown if using absolute links for images (not relative) and videos are embedded using YouTube, Vimeo or something similar
7. HTML contents only will be Grabbed - PHP and tech like AJAX is not possible

That's all folks!

Hope you like it and happy weaving!
